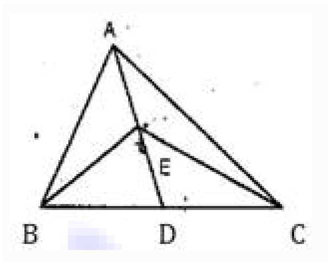
Q.1 In figure, E is any point on median AD of a Δ ABC. Show that ar (Δ ABE) = ar (Δ ACE).



Ans. In Δ ABC, AD is a median.

ar (Δ ABD) = ar (Δ ACD) ……….(i)

[∴ Median divides a Δ into two $\frac{1}{4}$ s of equal area]

Again, in Δ EBC, ED is a median

ar (Δ EBD) = ar (Δ ECD) ……….(ii)

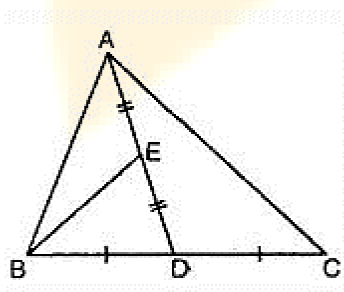
Subtracting eq. (ii) from (i),

ar (Δ ABD) – ar (Δ EBD) = ar (Δ ACD) – ar (Δ ECD)

⟹ ar (Δ ABE) = ar (Δ ACE)

Q.2 In a triangle ABC, E is the mid-point of median AD. Show that ar (BED) = $\frac{1}{4}$ ar (ABC).

Ans. Given: A Δ ABC, AD is the median and E is the mid-point of median AD.



To prove: ar (Δ BED) = $\frac{1}{4}$ ar (Δ ABC)

Proof: In Δ ABC, AD is the median.

∴ ar (Δ ABD) = ar (Δ ADC)

[∵ Median divides a Δ into two Δ s of equal area]

$\Rightarrow$ ar (Δ ABD) = $\frac{1}{2}$ ar (Δ ABC) ………. (i)

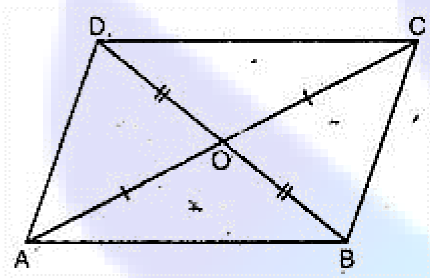
In Δ ABD, BE is the median.

∴ ar (Δ BED) = ar (Δ BAE)

$\Rightarrow$ ar (Δ BED) = $\frac{1}{2}$ ar (Δ ABD)

$\Rightarrow$ ar (Δ BED) = $\frac{1}{2} \times \frac{1}{2}$ ar (Δ ABC) = $\frac{1}{4}$ ar (Δ ABC)

Q.3 Show that the diagonals of a parallelogram divide it into four triangles of equal area.



Ans. Let parallelogram be ABCD and its diagonals AC and BD intersect each other at O.

In Δ ABC and Δ ADC,

AB = DC [Opposite sides of a parallelogram]

BC = AD [Opposite sides of a parallelogram]

And AC = AC [Common]

∴ Δ ABC ≅ Δ CDA [By SSS congruency]

Since, diagonals of a parallelogram bisect each other.

∴ O is the mid-point of bisection.

Now in Δ ADC, DO is the median.

∴ ar (Δ AOD) = ar (Δ COD) ……….(i)

[Median divides a triangle into two equal areas]

Similarly, in Δ ABC, OB is the median.

∴ ar (Δ AOB) = ar (Δ BOC) ………. (ii)

And in Δ AOB and Δ AOD, AO is the median.

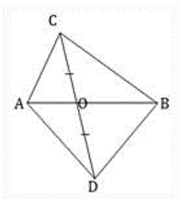
ar (Δ AOB) = ar (Δ AOD) ………. (iii)

From eq. (i), (ii) and (iii),

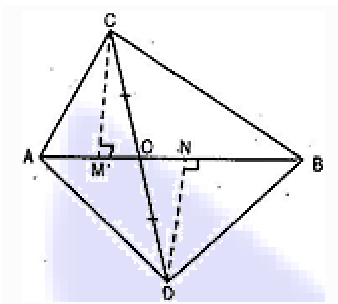
ar (Δ AOB) = ar (Δ AOD) = ar (Δ BOC) = ar (Δ COD)

Thus, diagonals of parallelogram divide it into four triangles of equal area.

Q.4 In figure, ABC and ABD are two triangles on the same base AB. If line-segment CD is bisected by AB at O, show that ar (ABC) = ar (ABD).



Ans. Draw CM ⊥ AB and DN ⊥ AB.



In Δ CMO and Δ DNO,

CMO = DNO = 90° [By construction]

∠ COM = ∠ DON [Vertically opposite]

OC = OD [Given]

Δ CMO ≅ Δ DNO [By ASA congruency]

∴ AM = DN [By CPCT] ……(i)

Now ar (Δ ABC) = $\frac{1}{2} \times AB \times CM$ ……….(ii)

ar (Δ ADB) = $\frac{1}{2} \times AB \times DN$……….(iii)

Using eq. (i) and (iii),

ar (Δ ADB) = $\frac{1}{2} \times AB \times CM$ ……….(iv)

From eq. (ii) and (iv),

ar (Δ ABC) = ar (Δ ADB)

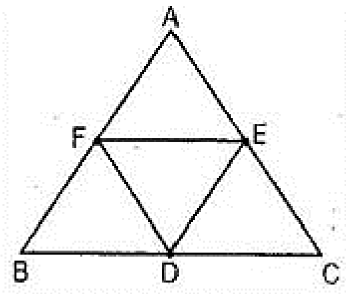
Q.5 D, E and F are respectively the mid-points of the sides BC, CA and AB of a Δ ABC. Show that:

(i) BDEF is a parallelogram.

(ii) ar (DEF) = $\frac{1}{4}$ ar (ABC)

(iii) ar (BDEF) = $\frac{1}{2}$ ar (ABC)

Ans. **(i)** F is the mid-point of AB and E is the mid-point of AC.



$\therefore$ FE ⊥BC and FE $= \frac{1}{2}$ BD

[$\because$ Line joining the mid-points of two sides of a triangle is parallel to the third and half of it]

FE ⊥ BD [BD is the part of BC]

And FE = BD

Also, D is the mid-point of BC.

$\therefore$ BD = $\frac{1}{2}$ BC

And FE ∥ BC and FE = BD

Again, E is the mid-point of AC and D is the mid-point of BC.

$\therefore$ DE ∥ AB and DE = $\frac{1}{2}$ AB

$\Longrightarrow$ DE ∥ AB [BF is the part of AB]

And DE = BF

Again, F is the mid-point of AB.

$\therefore$ BF = $\frac{1}{2}$ AB

But DE = $\frac{1}{2}$ AB

$\therefore$ DE = BF

Now we have FE ∥ BD and DE ∥ BF

And FE = BD and DE = BF

Therefore, BDEF is a parallelogram.

(ii) BDEF is a parallelogram.

$\therefore$ ar (Δ BDF) = ar (Δ DEF) ………. (i)

[diagonals of parallelogram divide it in two triangles of equal area]

DCEF is also parallelogram.

$\therefore$ ar (Δ DEF) = ar (Δ DEC) ……….(ii)

Also, AEDF is also parallelogram.

$\therefore$ ar (Δ AFE) = ar (Δ DEF) ……….(iii)

From eq. (i), (ii) and (iii),

$\therefore$ ar (Δ DEF) = ar (Δ BDF) = ar (Δ DEC) = ar (Δ AFE) ……….(iv)

Now, ar (Δ ABC) = ar (Δ DEF) + ar (Δ BDF) + ar (Δ DEC) + ar (Δ AFE) ……….(v)

$\therefore$ ar (Δ ABC) = ar (Δ DEF) + ar (Δ DEF) + ar (Δ DEF) + ar (Δ DEF)

[Using (iv) & (v)]

$\Rightarrow$ ar (Δ ABC) = 4 × ar (Δ DEF)

$\Rightarrow$ ar (Δ DEF) = $\frac{1}{4}$ ar (Δ ABC)

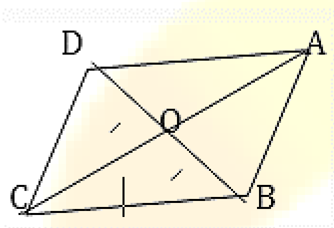
(iii) ar (‖ gm BDEF) = ar (Δ BDF) + ar (Δ DEF) = ar (Δ DEF) + ar (Δ DEF) [Using (iv)]

$\Rightarrow$ ar (‖ gm BDEF) = 2 ar (Δ DEF)

$\Rightarrow$ ar (‖ gm BDEF) = $2 \times \frac{1}{4}$ ar (Δ ABC)

$\Rightarrow$ ar (‖ gm BDEF) = $\frac{1}{2}$ ar (Δ ABC)

Q.6 In figure, diagonals AC and BD of quadrilateral ABCD intersect at O such that OB = OD. If AB = CD, then show that:

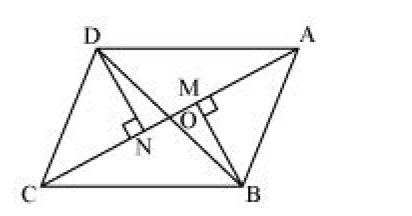


(i) ar (DOC) = ar (AOB)

(ii) ar (DCB) = ar (ACB)

(iii) DA || CB or ABCD is a parallelogram.

Ans. **(i)** Draw BM ⊥ AC and DN ⊥ AC.



In Δ DON and Δ BOM,

OD = OB [Given]

$\angle$ DNO = $\angle$ BMO = 90° [By construction]

$\angle$ DON = $\angle$ BOM [Vertically opposite]

$\therefore$ Δ DON $\cong$ Δ BOM [By RHS congruency]

$\Longrightarrow$ DN = BM [By CPCT]

$\therefore$ Also, ar (DON) = ar (BOM) ………. (i)

Again, In DCN and ABM,

CD = AB [Given]

$\angle$ DNC = $\angle$ BMA = 90° [By construction]

DN = BM [Prove above]

$\therefore$ Δ DCN $\cong$ Δ BAM [By RHS congruency]

$\therefore$ ar (DCN) = ar (BAM) ……….(ii)

Adding eq. (i) and (ii),

ar (Δ DON) + ar (Δ DCN) = ar (Δ BOM) + ar (Δ BAM)

$\Longrightarrow$ ar (Δ DOC) = ar (Δ AOB)

(ii) Since ar (Δ DOC) = ar (Δ AOB)

Adding ar Δ BOC both sides,

ar (Δ DOC) + ar Δ BOC = ar (Δ AOB) + ar Δ BOC

$\Longrightarrow$ ar (Δ DCB) = ar (ACB)

(iii) Since ar (DCB) = ar (ACB)

Therefore, these two triangles in addition to be on the same base CB lie between two same parallels CB and DA.

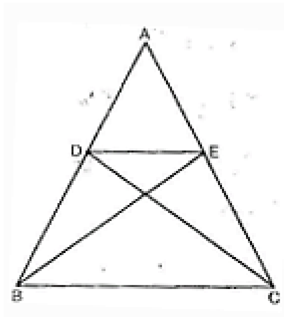
$\therefore$ DA $\perp$ CB

Now AB = CD and DA $\perp$ CB

Therefore, ABCD is a parallelogram.

Q.7 D and E are points on sides AB and AC respectively of Δ ABC such that ar (DBC) = ar (EBC). Prove that DE $\perp$ BC.

Ans. Given: ar (Δ DBC) = ar (Δ EBC)

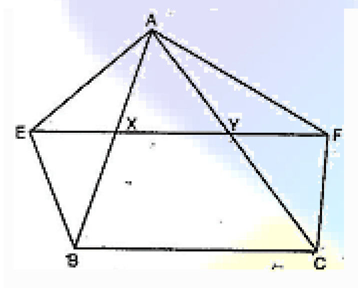


Since two triangles of equal area have common base BC.

Therefore, DE ∥ BC [Two triangles having same base (or equal bases) and equal areas lie between the same parallel]

Q.8 XY is a line parallel to side BC of triangle ABC. If BE ∥ AC and CF ∥ AB meet XY at E and F respectively, show that ar (ABE) = ar (ACF).

Ans. Δ ABE and parallelogram BCYE lie on the same base BE and between the same parallels BE and AC.



$\therefore$ ar (Δ ABE) = $\frac{1}{2}$ ar (∥ gm BCYE) .... (i)

Also Δ ACF and gm BC ∥ FX lie on the same base CF and between same parallel BX and CF.

$\therefore$ ar (Δ ACF) = $\frac{1}{2}$ ar (∥ gm BCFX) .... (ii)

But ∥ gm BCYE and gm BCFX lie on the same base BC and between the same parallels BC and EF.

$\therefore$ ar (gm BCYE) = ar (gm BCFX) ....(iii)

From eq. (i), (ii) and (iii), we get,

ar (Δ ABE) = ar (Δ ACF)

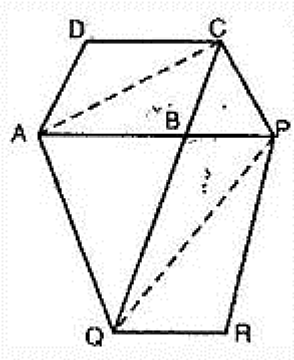
Q.9 The side AB of parallelogram ABCD is produced to any point P. A line through A and parallel to CP meets CB produced at Q and then parallelogram PBQR is completed. Show that ar (ABCD) = ar (PBQR).

Ans. Given: ABCD is a parallelogram, CP ⊥ AQ and PB ⊥ QR is a parallelogram.

To prove: ar (ABCD) = ar (PBQR)

Construction: Join AC and QP.

Proof: Since AQ ∥ CP



∴ ar (Δ AQC) = ar (Δ AQP)

[Triangles on the same base and between the same parallels are equal in area]

Subtracting ar (Δ ABQ) from both sides, we get

ar (Δ AQC – ar (Δ ABQ) = ar (Δ AQP) – ar (Δ ABQ)

⟹ ar (Δ ABC) = ar (Δ QBP) ……….(i)

Now ar (Δ ABC) = $\frac{1}{2}$ ar (∥ gm ABCD)

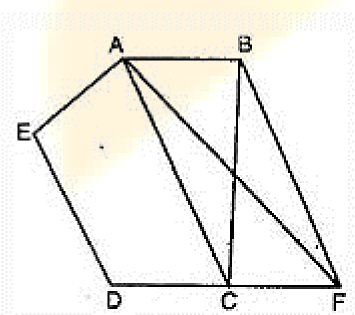
[Diagonal divides a parallelogram in two parts of equal area]

And ar (Δ PQB) = $\frac{1}{2}$ ar (∥gm PBQR)

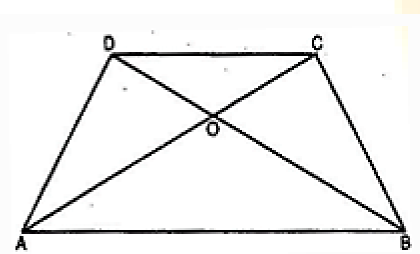
From eq. (i), (ii) and (iii), we get

ar (∥ gm ABCD) = ar (∥ gm PBQR)

Q.10 Diagonals AC and BD of a trapezium ABCD with AB ⊥ DC intersect each other at O. Prove that ar (AOD) = ar (BOC).



Ans. Δ ABD and Δ ABC lie on the same base AB and between the same parallels AB and DC.



∴ ar (Δ ABD) = ar (Δ ABC)

Subtracting ar (Δ AOB) from both sides,

ar (Δ ABD) – ar (Δ AOB)

= ar (Δ ABC) – ar (Δ AOB)

⟹ ar (Δ AOD) = ar (Δ BOC)

Q.11 In figure, ABCDE is a pentagon. A line through B parallel to AC meets DC produced at F. Show that:

(i) ar (ACB = ar (ACF)

(ii) ar (AEDF) = ar (ABCDE)

Ans. **(i)** Given that BF ⊥ AC

Δ ACB and Δ ACF lie on the same base AC and between the same parallel's AC and BF.

∴ ar (Δ ACB) = ar (Δ ACF) ………. (i)

(ii) Now ar (ABCDE) = ar (trap. AEDC) + ar (Δ ABC) ………. (ii)

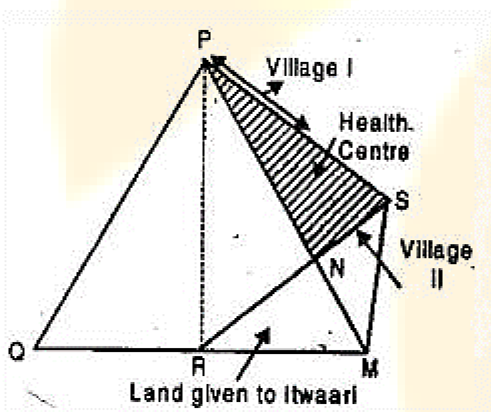
⟹ ar (ABCDE) = ar (trap. AEDC) + ar (Δ ACF) = ar (quad. AEDF) [Using (i)]

⟹ ar (AEDF) = ar (ABCDE)

Q.12 A villager Itwaari has a plot of land of the shape of quadrilateral. The Gram Panchyat of two villages decided to take over some portion of his plot from one of the corners to construct a health centre. Itwaari agrees to the above personal with the condition that he should be given equal amount of land in lieu of his land adjoining his plot so as to form a triangular plot. Explain how this proposal will be implemented.

Ans. Let Itwari has land in shape of quadrilateral PQRS.

Draw a line through 5 parallel to PR, which meets QR produced at M.



Let diagonals PM and RS of new formed quadrilateral intersect each other at point N.

We have PR ∥ SM [By construction]

∴ ar (ΔPRS) = ar (Δ PMR)

[Triangles on the same base and same parallel are equal in area]

Subtracting ar (Δ PNR) from both sides,

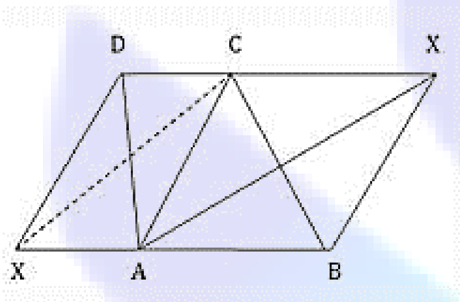
∴ ar (Δ PRS) – ar (Δ PNR) = ar (Δ PMR) – ar (Δ PNR)

ar (Δ PSN) = ar (Δ MNR)

It implies that Itwari will give corner triangular shaped plot PSN to the Gram panchayat for health centre and will take equal amount of land (denoted by MNR) adjoining his plot so as to form a triangular plot PQM.

Q.13 ABCD is a trapezium with ABDC. A line parallel to AC intersects AB at X and BC at Y. Prove that ar (ADX) = ar (ACY).

Ans. Join CX, Δ ADX and ACX lie on the same base XA and between the same parallels XA and DC.



∴ ar (Δ ADX) = ar (Δ ACX) ………. (i)

Also, Δ ACX and Δ ACY lie on the same base

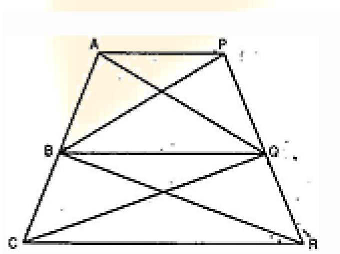
AC and between same parallels CY and XA.

∴ ar (Δ ACX) = ar (Δ ACY) ………. (ii)

From (i) and (ii),

ar (Δ ADX) = ar (Δ ACY)

Q.14 In figure, AP ∥ BQ ∥ CR. Prove that ar (AQC) = ar (PBR).



Ans. Δ ABQ and BPQ lie on the same base BQ and between same parallels AP and BQ.

∴ ar (Δ ABQ) = ar (Δ BPQ) ……….(i)

Δ BQC and Δ BQR lie on the same base BQ and between same parallels BQ and CR.

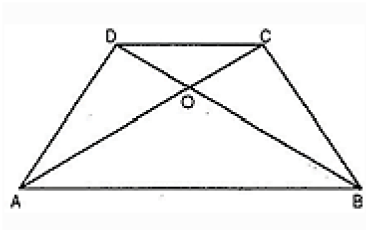
∴ ar (Δ BQC) = ar (Δ BQR) ………. (ii)

Adding eq (i) and (ii), ar (Δ ABQ) + ar (Δ BQC) = ar (Δ BPQ) + ar (Δ BQR)

⟹ ar (Δ AQC) = ar (Δ PBR)

Q.15 Diagonals AC and BD of a quadrilateral ABCD intersect at O in such a way that ar (AOD) = ar (BOC). Prove that ABCD is a trapezium.

Ans. Given that ar (Δ AOD) = ar (Δ BOC)



Adding Δ AOB both sides,

ar (Δ AOD) + ar (Δ AOB) = ar (Δ BOC) + ar (Δ AOB)

⟹ ar (Δ ABD) = ar (Δ ABC)

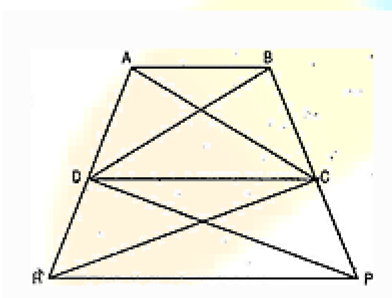
Since if two triangles equal in area, lie on the same base then, they lie between same parallels. We have ABD and ABC lie on common base AB and are equal in area.

∴ They lie in same parallels AB and DC. ⟹ AB ∥ DC

Now in quadrilateral ABCD, we have ABDC

Therefore, ABCD is trapezium. [∴ In trapezium one pair of opposite sides is parallel]

Q.16 In figure, ar (DRC) = ar (DPC) and ar (BDP) = ar (ARC). Show that both the quadrilaterals ABCD and DCPR are trapeziums.



Ans. Given that Δ DRC and Δ DPC lie on the same base DC and ar (Δ DPC) = ar (Δ DRC) .....(i)

∴ DC ∥ RP

[If two triangles equal in area, lie on the same base then, they lie between same parallels]

Therefore, DCPR is trapezium. [∴ In trapezium one pair of opposite sides is parallel]

Also ar (Δ BDP) = ar (Δ ARC) ....(ii)

Subtracting eq. (i) from (ii),

ar (Δ BDP) – ar (Δ DPC) = ar (Δ ARC) – ar (Δ DRC)

⟹ ar (Δ BDC) = ar (Δ ADC)

Therefore, ABDC [If two triangles equal in area, lie on the same base then, they lie between same parallels]

Therefore, ABCD is trapezium.
