

Board – CBSE

Class – 7th

Topic – Lines and Angle

**Q.1** Find the complement of each of the following angles:  $35^\circ$

**Ans:** The given angle measures  $35^\circ$ .

Let the measure of its complement be  $x$ .

$$x + 35^\circ = 90^\circ$$

$$\text{or } x = (90 - 35)^\circ = 55^\circ$$

Hence, the complement of the given angle will be  $55^\circ$ .

**Q.2** Find the complement of each of the following angles:  $73^\circ$

**Ans:** The given angle measures  $73^\circ$ .

Let the measure of its complement be  $x$ .

$$x + 73^\circ = 90^\circ$$

$$\text{or } x = (90 - 73)^\circ = 17^\circ$$

Hence, the complement of the given angle will be  $17^\circ$ .

**Q.3** Find the supplement of each of the following angles:  $80^\circ$

**Ans:** The given angle measures  $80^\circ$ .

Let the measure of its supplement be  $x$ .

$$x + 80^\circ = 180^\circ$$

$$\text{or } x = (180 - 80)^\circ = 100^\circ$$

Hence, the complement of the given angle will be  $100^\circ$ .

**Q.4** Find the supplement of each of the following angles:  $105^\circ$

**Ans:** The given angle measures  $105^\circ$ .

Let the measure of its supplement be  $x$ .

$$x + 105^\circ = 180^\circ$$

$$\text{or, } x = (180 - 105)^\circ = 75^\circ$$

Hence, the complement of the given angle will be  $75^\circ$ .

**Q.5** Among two supplementary angles, the measure of the larger angle is  $36^\circ$  more than the measure of the smaller. Find their measures.

**Ans:** Let the two supplementary angles be  $x^\circ$  and  $(180 - x)^\circ$ .

Since it is given that the measure of the larger angle is  $36^\circ$  more than the smaller angle, let the larger angle be  $x^\circ$ .

$$\therefore (180 - x)^\circ + 36^\circ = x^\circ$$

$$\text{or } 216 = 2x$$

$$\text{or } 108 = x$$

$$\text{Larger angle} = 108^\circ$$

$$\text{Smaller angle} = (108 - 36)^\circ$$

$$= 72^\circ$$

**Q.6** Find the angle which is equal to its supplement.

**Ans:** Let the measure of the required angle be  $x$ .

Since it is its own supplement:

$$x + x = 180^\circ$$

$$\text{or } 2x = 180^\circ$$

$$\text{or } x = 90^\circ$$

Therefore, the required angle is  $90^\circ$ .

**Q.7** In the given figure, AOB is a straight line and the ray OC stands on it.

If  $\angle AOC = 64^\circ$  and  $\angle BOC = x^\circ$ , find the value of  $x$ .

**Ans:** By linear pair property:

$$\angle AOC + \angle COB = 180^\circ$$

$$64^\circ + \angle COB = 180^\circ$$

$$\angle COB = x^\circ = 180^\circ - 64^\circ = 116^\circ$$

$$\therefore x = 116$$

**Q.8** In the given figure, AOB is a straight line and the ray OC stands on it.

If  $\angle AOC = (2x - 10)^\circ$  and  $\angle BOC = (3x + 20)^\circ$ , find the value of  $x$ .

Also, find  $\angle AOC$  and  $\angle BOC$

**Ans:** By linear pair property:

$$\angle AOC + \angle BOC = 180^\circ$$

$$\text{or } (2x-10)^\circ + (3x+20)^\circ = 180^\circ \quad (\text{given})$$

$$\text{or } 5x + 10 = 180$$

$$\text{or } 5x = 170$$

$$\text{or } x = 34$$

$$\therefore \angle AOC = (2x-10)^\circ = (2 \times 34 - 10)^\circ = 58^\circ$$

$$\angle BOC = (3x+20)^\circ = (3 \times 34 + 20)^\circ = 122^\circ$$

**Q.9** In the given figure, AOB is a straight line and the rays OC and OD stand on it.

If  $\angle AOC = 65^\circ$ ,  $\angle BOD = 70^\circ$  and  $\angle COD = x^\circ$  find the value of  $x$ .

**Ans:** Since AOB is a straight line, we have:

$$\angle AOC + \angle BOD + \angle COD = 180^\circ$$

$$\text{or } 65^\circ + 70^\circ + x^\circ = 180^\circ \quad (\text{given})$$

$$\text{or } 135^\circ + x^\circ = 180^\circ$$

$$\text{or } x^\circ = 45^\circ$$

Thus, the value of  $x$  is 45

**Q.10** In the given figure, two straight line AB and CD intersect at a point O.

If  $\angle AOC = 42^\circ$ , find the measure of the angles:  $\angle AOD$

**Ans:** AB and CD intersect at O and CD is a straight line.

$$\angle COA + \angle AOD = 180^\circ \quad (\text{linear pair})$$

$$42^\circ + \angle AOD = 180^\circ$$

$$\angle AOD = 138^\circ$$

**Q.11** In the given figure, two straight line AB and CD intersect at a point O.

If  $\angle AOC = 42^\circ$ , find the measure of the angles:  $\angle BOD$

**Ans:** AB and CD intersect at O and CD is a straight line.

$$\angle COA + \angle AOD = 180^\circ \quad (\text{linear pair})$$

$$42^\circ + \angle AOD = 180^\circ$$

$$\angle AOD = 138^\circ \quad (\text{i})$$

$\angle COA$  and  $\angle BOD$  are vertically opposite angles.

$$\therefore \angle COA = \angle BOD = 42^\circ \quad [\text{from (i)}]$$

**Q.12** In the given figure, two straight line PQ and RS intersect at a O.

If  $\angle POS = 114^\circ$ , find the measure of each of the angles:  $\angle POR$ ,  $\angle ROQ$ ,  $\angle QOS$

**Ans:**  $\angle POS + \angle POR = 180^\circ$  (linear pair)

$$\text{or } 114^\circ + \angle POR = 180^\circ$$

$$\text{or } \angle POR = 180^\circ - 114^\circ = 66^\circ$$

Since  $\angle POS$  and  $\angle QOR$  are vertically opposite angles, they are equal.

$$\therefore \angle QOR = 114^\circ$$

Since  $\angle POR$  and  $\angle QOS$  are vertically opposite angles, they are equal.

$$\therefore \angle QOS = 66^\circ$$

**Q.13** In the given figure, rays OA, OB, OC and OD are such that  $\angle AOB = 56^\circ$ ,  $\angle BOC = 100^\circ$

$\angle COD = x^\circ$  and  $\angle DOA = 74^\circ$ . Find the value of x.

**Ans:** Sum of all the angles around a point is  $360^\circ$ .

$$\therefore \angle AOB + \angle BOC + \angle COD + \angle DOA = 360^\circ$$

$$\text{or } 56^\circ + 100^\circ + x^\circ + 74^\circ = 360^\circ \quad (\text{given})$$

$$\text{or } 230^\circ + x^\circ = 360^\circ$$

$$\text{or } x^\circ = 130^\circ$$

$$\text{or } x = 130$$

**Q.14** Find the complement of each of the following angles:  $60^\circ$

**Ans:** The given angle measures  $60^\circ$ .

Let the measure of its complement be  $x^\circ$ .

$$x + 60^\circ = 90^\circ$$

$$\text{or } x = (90 - 60)^\circ = 30^\circ$$

Hence, the complement of the given angle will be  $30^\circ$ .

**Q.15** Find the supplement of each of the following angles:  $54^\circ$

**Ans:** The given angle measures  $54^\circ$ .

Let the measure of its supplement be x.

$$x + 54^\circ = 180^\circ$$

$$\text{or } x = (180 - 54)^\circ = 126^\circ$$

Hence, the complement of the given angle will be  $126^\circ$ .
