

Board – CBSE

Class – 8th

Topic – Direct and Inverse Proportion

Ex.1 If the cost of 15 pens of the same value is Rs. 600, find the cost of -

(i) 20 pens (ii) 3 pens.

Sol. Let us denote the required cost by x . Now, writing the like terms together, we have:

No. of Pens	Cost in rupees
15	600
20	x

(i)

$$\text{Ratio of pens} = \frac{15}{20} = \frac{3}{4}$$

$$\text{Ratio of rupees} = \frac{600}{x}$$

Since, more pens cost more money, so this is a case of direct variation.

$$\text{Therefore, } \frac{3}{4} = \frac{600}{x}$$

$$\text{or } 3 \times x = 600 \times 4$$

$$\text{or } x = \frac{600 \times 4}{3}$$

$$\text{or } x = 200 \times 4 = 800$$

\therefore The cost of 20 pens is Rs. 800.

$$\text{(ii) Again, ratio of pens} = \frac{15}{3} = \frac{5}{1}$$

$$\text{ratio of rupees} = \frac{600}{x}$$

$$\therefore \frac{5}{1} = \frac{600}{x}$$

$$\text{or } 5 \times x = 600 \times 1$$

$$\text{or } x = \frac{600}{5} = 120$$

\therefore The cost of 3 pens is Rs. 120.

Ex.2 Reema types 540 words during half an hour. How many words would she type in 6 minutes?

Sol. Suppose she types x words in 6 minutes. Then, the given information can be represented in the following tabular form:

Number of words	540	x
Time (in minutes)	30	6

Since in more time more words can be typed, it is case of direct variation.

\therefore Ratio of number of words = Ratio of number of minutes

$$\therefore \frac{540}{x} = \frac{30}{6} \Rightarrow x = \frac{6 \times 540}{30}$$

$$\therefore x = 108.$$

Hence, she types 108 words in 6 minutes.

Ex.3 In a boarding house of 80 boys, there is food provisions for 30 days. If 20 more boys join the boarding house, how long will the provisions last?

Sol. Obviously, more the boys the sooner would the provisions exhaust. It is, therefore, the case of inverse variation. The number of boys in the two situations are:

80 and $(80 + 20)$, i.e., 100 respectively. If the provisions last for x days when the number of boys increased from 80 to 100, we can have the following table:

Number of Boys	Number of Days
80	30
100	x

Here, the ratio between the like terms are:

$$\frac{80}{100} \text{ and } \frac{30}{x}$$

Since, the problem is of inverse variation, we will invert the ratio and then equate them:

$$\frac{x}{30} = \frac{80}{100}$$

$$\text{or } \frac{x}{30} = \frac{4}{5}$$

$$\text{or } x = \frac{4 \times 30}{5} = \frac{4 \times 6}{1}$$

$$\text{or } x = 24$$

Therefore, the provisions will last for 24 days.

Ex.4 A jeep finishes a journey in 9 hours at a speed of 60 km per hour. by how much should its speed be increased so that it may take only 6 hours to finish the same journey?

Sol. Let the desired speed of the jeep be x km per hour, then we have:

Number of Hours	Speed of the Jeep (in km per hour)
9	60
6	x

Since, the greater the speed, the lesser the time taken. Therefore, the number of hours and speed vary inversely.

$$\therefore \frac{9}{6} = \frac{x}{60}$$

$$\text{or } \frac{x}{60} = \frac{9}{6}$$

$$\text{or } x = \frac{9}{6} \times 60 = \frac{9 \times 10}{1} = 90$$

\therefore Increase in speed = $(90 - 60)$ km per hour = 30 km per hour

Thus, the required increase in speed is 30 km per hour.

Ex.5 A man takes 12 hours to travel 48 kilometres. How long will he take to travel 72 kilometres?

Sol. Since the man travels 48 km in 12 hours, therefore, one kilometer is travelled in $\frac{12}{48}$ hours.

\therefore He travels 72 km in $\frac{12 \times 72}{48}$ hours or in 18 hours.

Ex.6 A train of 320 metres length, is running at a speed of 72 km/h. How much time will it take to cross a pole?

Sol. Speed of the train = 72 km/h

$$= 72 \times 1000 \text{ m/h}$$

$$= \frac{72000}{60 \times 60} \text{ m/s} = 20 \text{ m/s}$$

Length of the train = 320 m

Since the train of length 320 m has to cross the pole of negligible dimension, it has to cross the length of itself, i.e., 320 m.

Thus, distance to be covered = 320 m

Now, using the relation $\text{time} = \frac{\text{Distance}}{\text{Speed}}$, we get the required time for the train to cross a distance of 320 m = $\frac{320}{20}$ [\therefore Speed of the train is 20 m/s (found above)]

Hence, the train takes 16 seconds to cross the pole.

Ex.7 Ratan takes 5 days to complete a certain job and Shankar takes 8 days to do the same job. If both of them work together, how long will they take to complete the work?

Sol. Since, Ratan takes 5 days to complete the given work

\therefore Ratan finishes $\frac{1}{5}$ part in 1 day.

Similarly, Shankar takes 8 days to complete the work.

Therefore, Shankar finishes $\frac{1}{8}$ part in 1 day.

\therefore In a day, they together will finish = $\frac{1}{5} + \frac{1}{8} = \frac{8+5}{40} = \frac{13}{40}$ i.e., $\frac{13}{40}$ part of the work.

So, they both will take $\frac{40}{13}$ days $3\frac{1}{13}$ days to complete the work. Hence, the complete work will be finished by them together in $3\frac{1}{13}$ days.

Ex.8 Kshitij can do a piece of work in 20 days and Rohan can do the same work in 15 days. They work together for 5 days and then Rohan leaves. In how many days will Kshitij alone finish the remaining work?

Sol. Since, Kshitij completes the work in 20 days

$$\therefore \text{Kshitij's 1-day work} = \frac{1}{20} \text{ part}$$

Now, Rohan completes the work in 15 days.

$$\text{Similarly, Rohan's 1-day work} = \frac{1}{15} \text{ part}$$

$$\therefore \text{Their combined work for 1 day} = \frac{1}{20} + \frac{1}{15} = \frac{3+4}{60} = \frac{7}{60}$$

$$\therefore \text{Their combined work for 5 days} = 5 \times \frac{7}{60} = \frac{7}{12} \text{ part}$$

$$\text{Remaining work} = \text{Complete work} - \text{Work done in 5 days} = 1 - \frac{7}{12} = \frac{12-7}{12} = \frac{5}{12} \text{ part}$$

Now, the remaining work is to be completed by Kshitij alone.

Kshitij can complete the whole work in 20 days.

$$\text{So, he will complete } \frac{5}{12} \text{ work in } \left(\frac{5}{12} \times 20\right) \text{ days, i.e., } \frac{25}{3} \text{ days or } 8\frac{1}{3} \text{ days.}$$

Ex.9 A and B can do a piece of work in 10 days; B and C in 15 days; C and A in 12 days. How long would A and B take separately to do the same work?

Sol. A and B can complete the work in 10 days.

$$\therefore (A \text{ and } B) \text{'s one day work} = \frac{1}{10} \text{ part}$$

Similarly,

$$(B \text{ and } C) \text{'s one day work} = \frac{1}{15} \text{ part}$$

$$(C \text{ and } A) \text{'s one day work} = \frac{1}{12} \text{ part}$$

$$\text{Adding up, we get } 2(A \text{ and } B \text{ and } C) \text{'s work in 1 day} = \left(\frac{1}{10} + \frac{1}{15} + \frac{1}{12}\right)$$

$$\text{part} = \frac{6+4+5}{60} = \frac{15}{60} = \frac{1}{4}$$

part

$$\therefore (A \text{ and } B \text{ and } C) \text{ can do in 1 day} = \frac{1}{4} \times \frac{1}{2} = \frac{1}{8} \text{ part}$$

Now,

Part of work A can do in 1 day = (1-day work of A and B and C) – (1-day work of B and C)

$$= \left(\frac{1}{8}\right) - \left(\frac{1}{15}\right) = \frac{15-8}{120} = \frac{7}{120} \text{ part}$$

Hence, A can complete the work in $\left(1 \times \frac{120}{7}\right)$ days, i.e., $\frac{120}{7}$ or $17\frac{1}{7}$ days.

Similarly,

Part of the work B can do in 1 day = (1-day work of A and B and C) – (1-day work of A and C)

$$= \left(\frac{1}{8}\right) - \left(\frac{1}{12}\right) = \frac{3-2}{24} = \frac{1}{24}$$

Hence, B can complete the work in $\left(1 \times \frac{24}{1}\right)$ days, i.e., 24 days.

Ex.10 A contractor undertakes to construct a road in 20 days and engages 12 workers.

After 16 days, he finds that only $\frac{2}{3}$ part of the work has been done. How many more workers should he now engage in order to finish the job in time?

Sol. From the question, it is clear that $\frac{2}{3}$ part of the work has been completed by 12 workers in 16 days.

$$\therefore \text{Remaining work} = 1 - \frac{2}{3} = \frac{1}{3}$$

$$\text{Remaining number of days} = 20 - 16 = 4$$

Thus, $\frac{1}{3}$ part of the work is to be finished in 4 days.

$$\therefore \text{Number of workers required to complete } \frac{2}{3} \text{ part of work in 16 days} = 12$$

$$\text{Number of workers required to complete 1 work in 16 days} = 12 \times \frac{3}{2} \times 16$$

$$\text{Number of workers required to complete } \frac{1}{3} \text{ work in 1 day} = 12 \times \frac{3}{2} \times 16 \times \frac{1}{3}$$

Number of workers required to complete $\frac{1}{3}$ work in 4 days = $12 \times \frac{3}{2} \times 16 \times \frac{1}{3} \times \frac{1}{4}$

\therefore Number of additional workers required = $24 - 12 = 12$

Hence, the contractor will have to engage 12 more workers to complete the work in time.

Ex.11 A garrison of 350 men had food for 25 days. However, after 5 days a reinforcement of 150 men join them. How long will the food last now?

Sol. As 350 men have already eaten the food for 5 days, so they will eat the remaining food in 20 days. Since 150 men have arrived, the number of men now becomes 500.

Thus, it can be represented in a tabular form as,

Men	350	500
Number of days	20	x

Clearly, it is the case of inverse proportion.

Thus, ratio of men = inverse ratio of number of days.

$$\text{or } \frac{350}{500} = \frac{x}{20} \text{ or } x = \frac{350 \times 20}{500} = 14$$

\therefore The food will last for 14 days.

Ex.12 Ashish takes 12 days to do a piece of work, while Arjun takes 15 days to do the work. Find the time taken by them if they work together.

Sol. Ashish takes 12 days to do piece of work.

\therefore In one day, he does $\frac{1}{12}$ th of the work.

Arjun takes 15 days to do a piece of work.

\therefore In one day, he does $\frac{1}{15}$ th of the work.

\therefore Together they do $\left(\frac{1}{12} + \frac{1}{15}\right)$ th of the work in one day.

$$\text{i.e. } \frac{1}{12} + \frac{1}{15} = \frac{5+4}{60} = \frac{9}{60} = \frac{3}{20}$$

\therefore In one day, they will finish $\frac{3}{20}$ th of the work

\therefore They take $\frac{20}{3} = 6\frac{2}{3}$ days to finish the work.

Ex.13 Two taps take 12 hours and 16 hours respectively to fill a tank. Find the time taken to fill the tank if they are open at the same time.

Sol. Time taken by first pipe = 12 hours

∴ In 1 hour, it fills $\frac{1}{12}$ th of the tank.

Time taken by second pipe = 16 hours

∴ In 1 hour, it fills $\frac{1}{16}$ th of the tank.

$$\therefore \text{Total work done in 1 hours} = \frac{1}{12} + \frac{1}{16} = \frac{4+3}{48} = \frac{7}{48}$$

∴ Time taken = $\frac{48}{7}$ hour = 6 hours 51 minutes (approximately).

Ex.14 Mohinder ploughs a field in 6 days and Ram ploughs the same field in 12 days. How long both of them take to plough the same field working together?

Sol. Mohinder ploughs in 6 days = 1 field

Mohinder ploughs in 1 day = $\frac{1}{6}$ th field

Ram ploughs in 1 day = $\frac{1}{12}$ th field

Both Ram and Mohinder ploughs in 1 day = $\left(\frac{1}{6} + \frac{1}{12}\right)$ th field. = $\frac{2+1}{12} = \frac{3}{12} = \frac{1}{4}$ field.

Now $\frac{1}{4}$ th of the field is ploughed by them in 1 day.

∴ The complete field will be ploughed by them in $1 \times \frac{4}{1} = 4$ days.

Ex.15 12 men working 8 hours a day complete a work in 10 days. How long would 16 men working $7\frac{1}{2}$ hours a day take to complete the same work?

Sol. Let the work completed in x days.

Men Hours Days 12 8 10 16 $\frac{15}{2}$ x More men less time Less men more time Thus, it is inverse variation

$$\therefore x = \frac{10 \times 12 \times 8 \times 2}{16 \times 15} = 8$$

∴ 16 men will complete the same work in 8 days.

Ex.16 2 men and 3 boys can harvest a field in 7 days. How long would 1 man and 2 boys take to harvest the same field?

Sol. Given that 2 men and 3 boys harvest a field in 7 days. Thus, let us calculate the amount of field harvested by each one in one day.

2 men harvest 1 field in 7 days.

In one day, 2 men will harvest $\frac{1}{7}$ th of the field.

In one day, 1 man will harvest $\frac{1}{2 \times 7}$ th, i.e. $\frac{1}{14}$ th of the field.

Similarly, 1 boy will harvest $\frac{1}{3 \times 7}$ th, i.e. $\frac{1}{21}$ th of the field in one day.

Now, we have to find the time taken by 1 man and 2 boys to harvest the field. Adding the amounts of work completed by 1 man and 2 boys in one day, we get

$$\frac{1}{14} + \frac{2}{21} = \frac{3+4}{42} = \frac{7}{42} \text{ or } \frac{1}{6}$$

Thus, they will take 6 days to complete the harvesting.

Ex.17 A man takes 2 hours to cover a distance when he walks at 3 kilometres per hour (kmph). Find the time taken if he walks at the rate of 4 kmph.

Sol. Speed = 3 km/h; Time = 2 hours

$$\therefore \text{Distance} = 3 \times 2 = 6 \text{ km}$$

New speed = 4 km/h

Distance = 6 km

$$\therefore \text{Time} = \frac{\text{Distance}}{\text{Speed}} = \frac{6}{4} = 1\frac{1}{2} \text{ hours}$$

Thus, the time taken by the man is $1\frac{1}{2}$ hours.

Ex.18 A train 375 m long takes 30 seconds to cross a pole. Find the speed of the train in kilometres per hour.

Sol. To cross a pole means the whole train should cross the pole.

$$\therefore \text{The distance travelled} = 375 \text{ m}$$

Time taken = 30 seconds

$\therefore \text{Speed} = \frac{\text{Distance}}{\text{Time}} = \frac{375}{30} \text{ ms}^{-1} = 12.5 \text{ ms}^{-1}$ In the above example, we have to

convert metres per second into kilometres per hour.

Now, 1 hour = 60×60 seconds, 1 km = 1000 m

$$\therefore \frac{\text{km}}{\text{hr}} = \frac{1000}{3600} \frac{\text{m}}{\text{s}} \quad 1 \frac{\text{km}}{\text{hr}} = \frac{5}{18} \frac{\text{m}}{\text{s}}$$

$$\text{or } 1 \text{ m/s} = \frac{18}{5} \text{ km/hr}$$

$$\therefore 12.5 \frac{\text{m}}{\text{s}} = 12.5 \times \frac{18}{5} = 2.5 \times 18 = 45 \text{ km/h}$$

Remember: To convert $\frac{\text{m}}{\text{s}}$ to $\frac{\text{km}}{\text{hr}}$ multiply by $\frac{18}{5}$.

To convert $\frac{\text{km}}{\text{hr}}$ to $\frac{\text{m}}{\text{s}}$, multiply by $\frac{5}{18}$.

Ex.19 A train 400 m long crosses an 800m long bridge. If it is travelling at 40 kmph, find the time taken to cross the bridge.

Sol. The distance travelled will be the whole length of the train and the whole length of bridge = 400 m + 800 m = 1200 m.

$$\text{Speed} = 40 \text{ km/h} = 40 \times \frac{5}{18} \text{ m/s} = \frac{100}{9} \text{ m/s}$$

$$\therefore \text{Time} = \frac{\text{Distance}}{\text{Speed}} = \frac{1200}{100/9} \text{ sec} = 108 \text{ sec or } 1 \text{ min } 48 \text{ sec.}$$

Ex.20 Two trains 132 m and 400 m in length are running on parallel tracks towards each other at 40 km/h and 55 km/h. Find the time taken to cross each other.

Sol. Since they are travelling towards each other, their relative speed will be (40 + 55) km/h = 95 km/h.

The distance travelled is the total length of the two trains,

i.e. 132 + 400 = 532 m.

$$\therefore \text{Time taken} = \frac{\text{Total distance}}{\text{Total Speed}} = \frac{532}{95 \times \frac{5}{18}}$$

$$= \frac{532 \times 18}{95 \times 5} = 20.16 \text{ seconds.}$$

Ex.21 Two trains of length 150 m and 180 m are running on parallel tracks in the same direction. Find the time taken to cross each other if their speeds are 35 km/h and 40 km/h.

Sol. Since they are moving in the same direction, the relative speed will be $(40 - 35)$ km/h = 5 km/h.

The distance covered will be total length of the two trains = $150 + 180 = 330$ m

$$\text{Time taken} = \frac{\text{Distance}}{\text{Speed}} = \frac{330}{5 \times \frac{5}{18}} = \frac{330 \times 18}{5 \times 5} = 237.6 \text{ seconds} = 3.96 \text{ minutes.}$$

Ex.22 A train moving at 30 km per hour completes its journey in 14 hours. How much time will the train take for the same journey if it travelled at 60 km per hour?

Sol. The given information can be shown in a tabular form as:

Speed (kmph)	30	60
Time (hours)	14	x

As the speed increases, the time decreases and the distance remains the same.

$$\therefore 30 \times 14 = 60 \times x \text{ (refers to distance).}$$

$$\therefore x = \frac{30 \times 14}{60} = 7 \text{ hours}$$

Thus, the train will take 7 hours to complete the journey moving at 60 km/hr.
